Java - Introduction to Programming Lecture 14

Bit Manipulation

Get Bit

```
public class Bits {
  public static void main(String args[]) {
    int n = 5; //0101
    int pos = 3;
    int bitMask = 1<<pos;

    if((bitMask & n) == 0) {
        System.out.println("bit was zero");
    } else {
        System.out.println("bit was one");
    }
}</pre>
```

Set Bit

```
import java.util.*;

public class Bits {
    public static void main(String args[]) {
        int n = 5; //0101
        int pos = 1;
        int bitMask = 1<<pos;

        int newNumber = bitMask | n;
        System.out.println(newNumber);
    }
}</pre>
```

Clear Bit

```
import java.util.*;
public class Bits {
  public static void main(String args[]) {
    int n = 5; //0101
    int pos = 2;
    int bitMask = 1<<pos;
    int newBitMask = ~(bitMask);
    int newNumber = newBitMask & n;
    System.out.println(newNumber);
}</pre>
```

Update Bit

Homework Problems

- 1. Write a program to find if a number is a power of 2 or not.
- 2. Write a program to toggle a bit a position = "pos" in a number "n".
- 3. Write a program to count the number of 1's in a binary representation of the number.
- 4. Write 2 functions => decimalToBinary() & binaryToDecimal() to convert a number from one number system to another. [BONUS]
